Developing Clinical Practice Guidelines

Facilitator
Michael McCaul
Centre for Evidence-Based Health Care, Division of Epidemiology, Stellenbosch University and
SA GRADE Network

Objectives
By the end of the workshop participants should be able to:

• Understand where clinical practice guidelines fit in the evidence eco-system
• Identify the core principles of developing a clinical practice guideline
• Identify, decide, and distinguish between different methods of developing clinical practice guidelines
• Be aware of different guideline tools and resources to support guideline development, reporting, appraisal, and technology/tools.

Brief description of content
Clinical practice guidelines (CPGs) represent the pinnacle of incorporating all the elements of evidence-based decision making; however, developing a CPG is not always so straightforward, especially if resources are limited. This interactive workshop aims to provide you with the basic knowledge, resources, and examples on how to navigate the CPG evidence eco-system in a practical and meaningful manner. The workshop is tailored to both participants who are new to guidelines and those who have been involved with guidelines for many years. Participants will share and engage together whether attending virtually, or live at the Indaba.

To maximise engagement and learning, participants should have a reliable internet connection either via computer or smart phone, whether attending in person or virtually (as participation will be via online polls)
